Productivity Effects of Internal and External R&D: Evidence on Market Competition and Spillover Interactions

Seonh-Hoon Cho and Jaimin Lee

Introduction

- Internal R&D: proprietary R&D investment conducted internally by the firm, in-house R&D activities
- External R&D: R&D investment outsourced to external entities, externally contracted R&D investment
- Examine how internal and external R&D investments affect total factor productivity (TFP) under varying levels of market competition
- Examine how internal and external R&D spillover effects affect TFP under varying levels of market competition

Introduction

- Compare productivity effects of internal vs. external R&D
- Assess how market competition moderates these effects
- Compare productivity effects of internal R&D spillover vs. external R&D spillover
- Assess how market competition moderates these effects
- Provide empirical evidence on the role of competitive pressure in shaping the effectiveness of firm-level innovation strategies

Introduction

- First: Internal R&D tends to generate more tailored and proprietary innovations, leading to greater productivity gains
- Second: Both internal and external R&D investments exhibit higher performance in markets characterized by intense competition
- Third: Spillover effects from externally acquired R&D are substantially larger than those from internal R&D
- Fourth: Both internal and external R&D generate stronger spillover effects in less competitive markets

$$TFP_{it} = \Phi_{in}(M_{it})IRD_{it}^{\theta_{in}} + \Phi_{ex}(M_{it})ERD_{it}^{\theta_{ex}} + \Psi_{in}(M_{it})S_{it,in}^{\gamma_{in}} + \Psi_{ex}(M_{it})S_{it,ex}^{\gamma_{ex}}$$

- IRD_{it} and ERD_{it}: internal and external R&D
- S_{in,it} and S_{ex,it}: internal and external R&D spillovers
- θ_{in} , θ_{ex} , γ_{in} , and γ_{ex} : coefficients associated with marginal effects of internal and external R&D investments and their spillover variables (less than one)
- $\Phi_{in}, \Phi_{ex}, \Psi_{in}, and \Psi_{ex}$: markup-dependent productivity coefficients and markup-dependent spillover coefficients
- M_{it}: markups for each firm

First

$$-\frac{\partial TFP_{it}}{\partial IRD_{it}} = \Phi_{in}(M_{it})\theta_{in}IRD_{it}^{\theta_{in}-1} > 0 \quad \text{and} \quad \frac{\partial TFP_{it}}{\partial ERD_{it}} = \Phi_{ex}(M_{it})\theta_{ex}ERD_{it}^{\theta_{ex}-1} > 0$$

$$-\frac{\partial TFP_{it}}{\partial S_{it,in}} = \Psi_{in}(M_{it})\gamma_{in}S_{it}^{\gamma_{in}-1} > 0 \quad \text{and} \quad \frac{\partial TFP_{it}}{\partial S_{it,ex}} = \Psi_{ex}(M_{it})\gamma_{ex}S_{it}^{\gamma_{ex}-1} > 0$$

$$\frac{\partial TFP_{it}}{\partial ERD_{it}} = \Phi_{ex}(M_{it})\theta_{ex}ERD_{it}^{\theta_{ex}-1} > 0$$

$$\frac{\partial TFP_{it}}{\partial S_{it,ex}} = \Psi_{ex}(M_{it})\gamma_{ex}S_{it}^{\gamma_{ex}-1} > 0$$

- Second: $\frac{\partial TFP_{it}}{\partial IRD_{it}} > \frac{\partial TFP_{it}}{\partial ERD_{it}}$
 - In-house research generates a larger share of tacit, firmspecific knowledge that is difficult to codify and imitate, allowing the innovating firm to capture a greater portion of the returns (Nelson and Winter, 1982; Teece, 1986)
 - External R&D—through licensing or contract research—tends to produce more standardized knowledge with weaker protection against imitation, thereby reducing the focal firm's ability to fully appropriate its benefits (Cohen and Levinthal, 1989; Cassiman and Veugelers, 2006)

- Third: $\frac{\partial TFP_{it}}{\partial S_{it,in}} < \frac{\partial TFP_{it}}{\partial S_{it,ex}}$
- External R&D often produces knowledge that is more codified, standardized, and explicitly documented, which facilitates diffusion across firms and industries (Knott, 2008)
- Internal R&D creates a larger share of tacit and firm-specific knowledge, embedded in routines and organizational practices, which is less transferable and thus less likely to generate measurable spillover effects (Nelson and Winter, 1982)

• Fourth: Effects of internal and external R&D investment are greater for firms operating in low-markup segments (i.e., highly competitive environments), whereas they are smaller for firms in high-markup segments (i.e., less competitive environments)

$$\frac{\partial^{2} TFP_{it}}{\partial IRD_{it} \partial M_{it}} = \underbrace{\Phi_{in} '(M_{it}) \theta_{in} IRD_{it}^{\theta_{in}-1}}_{Competition \ Chanel < 0} + \underbrace{\Phi_{in} (M_{it}) \theta_{in} (\theta_{in} - 1) IRD_{it}^{\theta_{in}-2}}_{Di \ min \ ishing \ M \ arg \ inal \ \ Re \ turns < 0} \times \underbrace{\frac{dIRD_{it}}{dM_{it}}}_{>0} < 0$$

$$\frac{\partial^{2} TFP_{it}}{\partial ERD_{it} \partial M_{it}} = \underbrace{\Phi_{ex} '(M_{it}) \theta_{ex} ERD_{it}^{\theta_{ex}-1}}_{Competition \ Chanel < 0} + \underbrace{\Phi_{ex} (M_{it}) \theta_{ex} (\theta_{ex} - 1) ERD_{it}^{\theta_{ex}-2}}_{Di \ min \ ishing \ M \ arg \ inal \ \ Returns < 0} \times \underbrace{\frac{dERD_{it}}{dM_{it}}}_{> 0} < 0$$

• Fifth: Effect of R&D spillovers will increase as the markup rises

$$\frac{\partial^{2}TFP_{it}}{\partial S_{it,in}\partial M_{it}} = \underbrace{\Psi_{in} '(M_{it})\gamma_{in}S_{it,in}^{\gamma_{in}-1}}_{Competition Chanel>0} + \underbrace{\Psi_{in}(M_{it})\gamma_{in}(\gamma_{in}-1)S_{it,in}^{\gamma_{in}-2}}_{Di \, min \, ishing \, M \, arg \, inal \, Re \, turns<0} \times \frac{dS_{it,in}}{dM_{it}}$$

$$\frac{\partial^{2}TFP_{it}}{\partial S_{it,ex}\partial M_{it}} = \underbrace{\Psi_{ex} '(M_{it})\gamma_{ex}S_{it,ex}^{\gamma_{ex}-1}}_{Competition \, Chanel>0} + \underbrace{\Psi_{ex}(M_{it})\gamma_{ex}(\gamma_{ex}-1)S_{it,ex}^{\gamma_{ex}-2}}_{Di \, min \, ishing \, M \, arg \, inal \, Re \, turns<0}_{>0} \times \frac{dS_{it,in}}{dM_{it}}$$

- Under weak competition, firms possess greater slack and absorptive capacity, enabling them to better internalize external knowledge and thereby amplify the productivity impact of R&D spillovers

Data

 Use the data from the South Korea's Statistical Office's Firm Activity Survey from 2006 to 2018

 $Table \cdot 1. \cdot Summary \cdot Statistics \cdot for \cdot Key \cdot Variables \leftarrow$

Both←	5.13 ←	39.83 ←	1.01 ←	54.03 ←			
All∙firms⊲	27.28 ←	64.49 ←	1.04 ←	7.19 ←			

Notes: The table shows the percentage of firms transitioning between R&D investment categories from year to year t+1. Structure follows Aw, Roberts, and Xu (2011) on R&D and export dynamics.

 Firms that make internal R&D investments tend to be more persistent compared to those that make external R&D investments

- From <Table 3 & 4>: Internal R&D investments tend to be more persistent External R&D investments
- Irreversibility of internal R&D investments: Czarnitzki and Toole (2011, 2013), Cho and Lee (2021)
- Sunk cost: Manez et al. (2009), Manez and Love (2020) . Lee and Kim (2022)
- Friction and adjustment for internal R&D: Schankerman and Nadiri (1984), Bloom (2007), Doraszelski and Jaumandreu (2013), Aysun (2020), Aysun et al. (2025)
- Uncertainty or risk for internal R&D: Bloom (2007), Czarnitzki and Toole (2011, 2013), Doraszelski and Jaumandreu (2013), Lee and Kim (2022)

Production Function Estimation and TFP

 Use C-D production function using Olley and Pakes (1996) and Levinsohn and Petrin (2003) and construct TFP

$$y_{it} = \beta_i l_{it} + \beta_k k_{it} + \beta_m m_{it} + \Gamma Y D_t + IRD_t + OSIC_i + \omega_{it} + u_{it} \rightarrow \rightarrow \rightarrow \rightarrow (1) \leftarrow ($$

Table 5. Production Function Estimation Results←

<u>+</u>			
Input←	Coefficient Estimates←	Standard∙Errors⇔	←
Labor←	0.412***←	0.007←ੋ	←
Capital←	0.092***←	0.005←ੋ	←
Material←	0.221***←	0.007←ੋ	←
1714101141	0.221	0.007	

Notes: Standard errors are reported in parentheses. ***, ***, and ** denote statistical significance at the 1%, 5%, and 10% levels, respectively. Estimates are based on 75,537 observations from 10,180 firms. Year, region, and two-digit industry fixed effects are included. ←

Firm Level Markups

- Measure of Competition: Markup=P/MC
- Follow De Loecker (2011) and De Loecker and Warzynski (2012)

$$markup (\mu_{it}) = \frac{\beta_m}{\alpha_{it}^m}, \quad \rightarrow \quad (3) \in \mathcal{A}$$

• where β_m is the output elasticity of material costs or the coefficient estimate in production function and α_m is the proportion of material costs to sales revenue

R&D Spillover Variables

 Define two proxy variables of the spillover effects following Knott (2008)

• Leader Distance: $S_{ijt} = \max(R \& D_{ijt}) - R \& D_{ijt}$

• Sum Above: $S_{ijt} = \sum_{i \neq f} R \& D_{ijt}, R \& D_{ijt} > R \& D_{fjt}$

TFP, Spillovers, and Markups

Table 6. Summary Statistics for Firm-Level TFP, Markup, and Spillover Effect Variables of

Internal and External R&D Investment←

۲۵	Mean⊲	Median←	Standard Deviation ←		
TFP←	70←	56↩	77←	<u>-</u>	
Markup←	1.315↩	0.414←	39.873₽	÷	
Internal·R&D·leader·	1,344,510₽	128,675↩	3,019,915↩	÷	
External·R&D·leader·	92,457₽	9,340↩	177,624←	÷	
Internal ·R&D ·sum ·above←	2,722,920€	555,977←	5,220,807←	÷.	
External R&D sum above	154,591₽	27,534←	274,326←	←	

Notes: TFP is calculated as the exponentiated predicted output from equation (1), effectively converting log TFP estimates into monetary units (million Korean won, KRW). The variables of Internal and External R&D investment spillover effect variables are also measured in monetary units, specifically in million KRW.

Empirical Model and Estimation Method

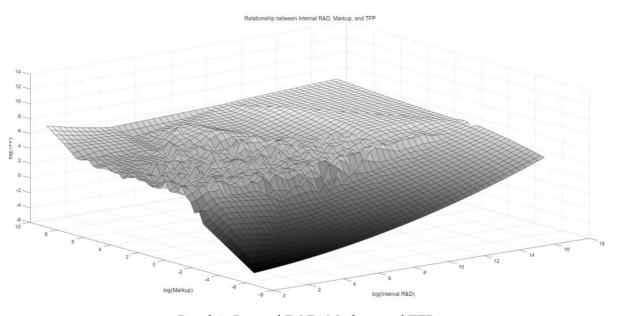

Empirical Estimation Model

$$tfp_{it} = \beta_0 + \beta_1 ird_{it} + \beta_2 erd_{it} + \beta_3 equity_{it} + \beta_4 ird _so_{it} + \beta_5 erd _so_{it}$$

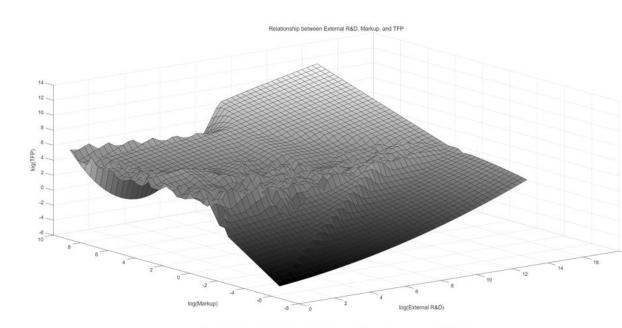

$$+\Gamma YD_t + IRD_i + OSIC_i + a_i + v_{it}$$

• Estimation Method: Fixed Effects Instrumental Variable(FEIV) Estimation Method

Effects of Internal and External R&D

- Effects of Internal and External R&D on TFP are significantly positive
- Effects of both internal and external R&D investment on Total Factor Productivity (TFP) are higher when markups are low, indicating stronger competition
- Effect of internal R&D investment on TFP is greater than that of external R&D investment
- However, as competition intensifies (markups decrease), the gap between the effects of internal and external R&D investments narrows

Effects of Internal and External R&D

 Spillover effect of external R&D investment om TFP is greater than that of internal R&D investment

• Effects of both internal and external R&D Spillovers tend to be larger when competition is weak (i.e., when markups are high)

Concluding Remarks

Try to address the policy implications!

Try to link empirical results with real-world cases!
